

## Completion of acquisition of the Coringa gold project, Brazil

---

**Serabi Gold plc (AIM:SRB, TSX:SBI), the Brazilian-focused gold mining and development company, is pleased to report that it has now completed the acquisition of 100 per cent of the issued share capital and inter-company debt of Chapleau Resources Ltd (“Chapleau”), a Canadian registered company previously wholly-owned by Anfield Gold Corp (“Anfield”). Chapleau holds the Coringa gold project (“Coringa”) located in the Tapajos gold province in Para, Brazil.**

Coringa hosts a mineral resource estimate of 376,000 ounces of gold, including an Indicated Resource of 195,000 ounces of gold with an average grade of 8.4 grammes per tonne (“g/t”), which has been prepared in accordance with the reporting requirements of the standards of NI 43-101. Estimated mineral reserves, included with the mineral resource, are 160,000 ounces of gold. Coringa is located some 70 kilometres to the south-east of the town of Novo Progresso which is approximately 130 kilometres by road to the south of Serabi’s current mining operations at Palito.

Completion of the acquisition occurred on 21 December 2017 (“**Closing**”). Serabi has made an initial payment to Anfield on Closing of US\$5 million in cash (“**Initial Consideration**”). A further US\$5 million in cash is payable within three months of Closing and a final payment of US\$12 million in cash will be due upon the earlier of either the first gold being produced or 24 months from the date of Closing (both payments together being the “**Deferred Consideration**”). The total proposed consideration for the acquisition amounts to US\$22 million in aggregate.

### Significant Benefits of the transaction

The Board of Serabi believes that the acquisition of the Coringa gold project has a number of key benefits including:

- Coringa hosts an Indicated Mineral Resource of 195,000 ounces of gold at 8.36 g/t and an Inferred Mineral Resource of 181,000 ounces gold at 4.32 g/t (the “**Coringa Mineral Resource Estimate**”) prepared in accordance with the reporting requirements of the standards of NI 43-101.
- Coringa is located only 200 kilometres from Serabi’s current Palito mining operation and process plant, allowing synergies for management and infrastructure and potential reduction of unit operating costs.
- The Coringa project is a near ‘carbon-copy’ of Serabi’s current operation, which has been in production since 2014. The similarities mean Serabi is very well placed to expedite the successful development and future production potential of the project.
- Past gold discoveries at Coringa including the Mae de Leite, Come Quietto, Demetrio and Valdetto veins, have not been included in the current Coringa Mineral Resource Estimate and provide scope for growing the resources and expanding the life of the project.
- A feasibility report on Coringa issued by Anfield in September 2017 (the “**Coringa Feasibility Study**”), prepared in accordance with the reporting requirements of the standards of NI 43-101, estimated:
  - an average production rate of 32,000 ounces per annum and a total mineable reserve of approximately 160,000 ounces of gold;
  - average all-in sustaining costs of US\$783 per ounce; and
  - a post-tax IRR of 30.8 per cent.

## PRESS RELEASE 22 DECEMBER 2017

SERABI GOLD plc ("Serabi" or "the Company")

- Serabi considers that scope exists to reduce capital and operating costs at Coringa by utilising Serabi's existing gold processing facilities at Palito.
- Book value, as at 30 September 2017, attributed by Anfield to property, plant and equipment being acquired, including a 750 tonnes per day crushing, milling and CIP process plant, is C\$20.8 million.

Michael Hodgson, CEO of Serabi commented.

***"Coringa is an asset we have been trying to secure for some time now, and its proximity, and similarity to the Palito and Sao Chico ore-bodies make this acquisition something of a 'must have' for us.***

***"We pride ourselves on being the best at what we do in Brazil. The existing Palito and Sao Chico operations demonstrate our strong credentials as high-grade, quality, underground operators, and we see Coringa as the next 'cab off the rank'.***

***"The Coringa project brings with it approximately 400,000 ounces of high grade resources which, combined with our own recently updated resource estimation for the Palito and Sao Chico ore-bodies, brings the Group close to having one million ounces of gold resources. This is a key milestone for any junior gold company, and within this resource we have a total combined mineral reserve of approximately 350,000 ounces.***

***"However, we very much see Coringa as an asset that can be grown, and grown quickly, into what can become a significant, long-life asset. The strike extent and continuity of the historical artisanal gold mining activity shows the deposit has very significant upside, with abundant drilling targets. We therefore consider the current and maiden mineral reserve at Coringa as very much just the start of what we believe to be a very exciting opportunity.***

***"With our experience, team and the knowledge acquired from building Palito and then Sao Chico, we feel very well positioned to develop Coringa quickly and efficiently. The orebody, the mining, the processing and environmental management of the operation are all so similar to Palito and Sao Chico, that it fits perfectly with our known strengths. Our management and key personnel in Serabi will be able to accelerate project advancement and this will be the third time that they will have worked together on developing such an operation.***

***"Coringa is ready to build once the final permits are in place and the early part of 2018 will be a key time for advancing the issuance of the necessary approvals and licences. With Coringa being located in the state of Para, we can benefit from the excellent relationships we already enjoy with such agencies as the Departamento Nacional de Produção Mineral ("DNPM") and Secretaria de Estado de Meio Ambiente e Sustentabilidade ("SEMAS") to get the operation permitted efficiently and into production.***

***"The proximity of the project to the current Palito complex also brings obvious operational synergies. Senior management, finance, H.R. and maintenance, are all obvious areas where resources can be shared.***

***"With exploration drilling now underway at Palito and shortly to begin at Sao Chico, we see excellent organic growth prospects there, where we feel confident we can quickly turn exploration success into increased production ounces. At Palito the 27 veins that comprise the mineral resource are currently within an overall one kilometre strike length. However, numerous intersections suggest the veins are traceable for up to four kilometres, so the current step-out drilling is essential. The story is much the same at Sao Chico where the main vein remains open in all directions along strike and at depth.***

***"Over the next 12-24 months, we aim to see the fruits of our organic growth effort at Palito and Sao Chico along with the development of Coringa, place Serabi in amongst the 100,000 ounces per annum producers, but,***

PRESS RELEASE 22 DECEMBER 2017

SERABI GOLD plc ("Serabi" or "the Company")

*I emphasise, not at the expense of compromising on quality. Our niche is quality, high grade mining and our aim, is to do more of it."*

An interview with Michael Hodgson of Serabi, discussing the acquisition of Coringa, can be accessed by using the following link:

<https://www.brrmedia.co.uk/broadcasts-embed/5a3943e115a38759b1b01bc7/event/?livelink=true&popup=true>

## Acquisition Agreement

The acquisition agreement initially signed on 13 November provided for Serabi to acquire 100 per cent of the issued share capital of Chapleau and to be assigned the benefit of all of Chapleau's outstanding inter-company debts that had been advanced by Anfield and other Anfield group companies (the "Agreement"). Chapleau owns 100 per cent of the shares of Chapleau Exploração Mineral Ltda ("Chapleau Brazil"). Chapleau Brazil holds mineral rights consisting of seven concessions totalling 13,648 hectares, including Coringa. Chapleau also owns 100 per cent of the shares of Chapleau Resources (USA) Limited ("Chapleau USA") which holds a 10 per cent interest in the Patty JV covering 616 mining claims in Nevada, USA. The other JV participants are Barrick Gold US Inc. and McEwen Mining Inc. The projected costs to Chapleau USA for 2018, in respect of the JV, are approximately US\$20,000.

Serabi has paid the Initial Consideration from its existing cash resources. Following Closing a completion balance sheet will now be prepared and the Initial Consideration will be adjusted dollar-for-dollar for the amount, if any, by which the working capital on Closing exceeds or is less than US\$nil. Anfield has assigned to Serabi all the benefit of all outstanding intercompany loans between Chapleau and Anfield, and Chapleau is now obliged to repay these to Serabi.

A further US\$17 million is the Deferred Consideration, of which an initial payment of US\$5 million in cash is payable within three months of Closing and a final payment of US\$12 million in cash will be due upon the earlier of either the first gold being produced or 24 months from the date of Closing. The total consideration for the acquisition amounts to US\$22 million in aggregate (before any working capital adjustments).

Anfield has provided Serabi with certain indemnities in respect of future claims relating to activities prior to Closing, including labour and tax liabilities and the Agreement includes representations and warranties from Anfield in favour of Serabi as would be customary for a transaction of this nature.

Serabi has, with the approval of Serabi's secured lender and sub-ordinated to the security granted by Serabi to its secured lender, granted to Anfield a pledge over the shares of Chapleau as security for the full and irrevocable payment of the Deferred Consideration.

## Further information on Coringa

Coringa is located in north-central Brazil, in the State of Pará, 70 kilometres southeast of the city of Novo Progresso. Access to the property is provided by paved (National Highway BR-163) and gravel roads. Coringa is in the south eastern part of the Tapajós gold district, Brazil's main source of gold from the late 1970s to the late 1990s. Artisanal mining at Coringa produced an estimated 10 tonnes of gold (322,600 ounces) from alluvial and primary sources within the deep saprolite or oxidized parts of shear zones being mined using high-pressure water hoses or hand-cobbing to depths of 15 metres. Other than the artisanal workings, no other production has occurred at Coringa. Artisanal mining activity ceased in 1991 and a local Brazilian company (Tamin Mineração Ltda.) staked the area in 1990. Subsequently, the concessions were optioned to Chapleau (via its then subsidiary,

## PRESS RELEASE 22 DECEMBER 2017

SERABI GOLD plc ("Serabi" or "the Company")

Chapleau Brazil) in August 2006. On 1 September 2009, Magellan Minerals Ltd. ("**Magellan Minerals**") acquired Chapleau. Between 2007 and 2013, extensive exploration programmes were completed on the property, including airborne magnetic, radiometric and electro-magnetic surveys; surface IP surveys; stream, soil, and rock sampling; and trenching and diamond drilling (179 holes for a total length of 28,437 meters). On 9 May 2016, Anfield acquired Magellan Minerals. Anfield subsequently completed an infill drill programme (183 holes for a total length of 26,413 meters) for the Serra and Meio veins in 2016 and 2017.

Coringa is an advanced project currently at the resource development stage.

Following completion of the drilling programme undertaken by Anfield and the Coringa Feasibility Study, activity has been significantly reduced whilst Anfield has progressed the licencing and permitting process. There are currently approximately 35 personnel employed by Chapleau Brazil.

The Coringa Feasibility Study has an effective date of 1 July 2017 and it incorporates all expenditures prior to that date. The base case economics are based on a gold price of US\$1,250 per ounce, silver price of US\$18 per ounce and an exchange rate of 3.2 (US\$ to Brazilian Real). The Coringa Feasibility Study highlights included the following estimates:

- Gold production of approximately 32,000 ounce per year averaged over a 4.8 year mine life;
  - Average life of mine process fully-diluted gold grade of 6.5 g/t;
  - Post-tax internal rate of return of 30.8 per cent;
  - Post-tax net present value of US\$31.0 million at a 5 per cent discount rate;
  - Remaining capital costs of US\$28.8 million;
  - Average net cash operating costs of US\$585 per ounce and all-in sustaining costs of US\$783 per ounce;
- and
- Probable mineral reserves of 161,000 ounces of gold and 324,000 ounces of silver.

The total fully-diluted estimate of mineral resources for Coringa, prepared in accordance with the reporting requirements of the standards of NI 43-101, included in the Coringa Feasibility Study were reported as follows:

Classification	Tonnes ('000's)	Au grade (g/t)	Ag grade (g/t)	Contained gold (oz)	Contained Silver (oz)	Cut-off grade (g/t Au)
Serra Probable Reserves	498	6.0	12.8	97,000	204,000	2.50
Meio Probable Reserves	196	7.4	14.6	46,000	92,000	2.38
Galena Probable Reserves	74	7.1	11.2	17,000	27,000	2.50
<b>Total Probable Reserves</b>	<b>769</b>	<b>6.5</b>	<b>13.1</b>	<b>161,000</b>	<b>324,000</b>	
Indicated Resource	726	8.4	17.0	195,000	396,000	2.00

## PRESS RELEASE 22 DECEMBER 2017

### Notes:

- (i) *Additional information, including with respect to the mineral resource estimate, metallurgy, data verification and quality control measures, can be found in Anfield's technical report titled "Coringa Gold Project, Brazil, Feasibility Study NI 43-101 Technical Report" with an effective date of 1 July 2017, which is filed on SEDAR at [www.sedar.com](http://www.sedar.com). The mineral resource estimate was prepared in accordance with the standard of CIM and NI 43-101.*
- (ii) *Totals in the above table may not add due to rounding.*
- (iii) *Grades are reported on a fully-diluted basis.*
- (iv) *Chapleau Brazil is the Operator and owns 100% of Coringa such that gross and net attributable resources are the same.*
- (v) *Serabi has not independently verified the information.*

There are approximately 40,000 ounces of estimated inferred mineral resource, which are not included in the Coringa Feasibility Study's mine plan, that are adjacent to areas mined as part of the Coringa Feasibility Study. In addition, Chapleau Brazil controls a 20 kilometre area in the district with delineated gold soil anomalies, of which, the drill-defined mineral resource strike length is approximately two kilometres.

On 14 August 2017, Anfield announced that it had received key permits required to commence construction of the Coringa project, being (1) the license of operation for exploration and trial mining, (2) the vegetation suppression permit and (3) fauna capture permit, all issued by the SEMAS. The SEMAS permits contain a list of conditions for the conservation and protection of fauna and flora. In addition, Chapleau Brazil is required to comply with requirements related to: fuel storage; waste storage; transportation, storage and use of explosives; surface water drainage; archaeology; and worker health and safety programmes. The Company is also required to submit regular reports on operational, environmental, and social performance. These conditions and requirements will be met as part of normal course operations.

The next step in the permitting process will be for a formal trial mining licence to be issued by the DNPM. The trial mining licence will authorise the Company to commence mine development and production from Coringa. The trial mining licence will authorise mining and processing of up to 50,000 tonnes of ore per year at Coringa. Under applicable regulations, once the mine is operational, Chapleau Brazil may apply to the DNPM to increase the processing limit.

On 27 September 2017, Anfield announced that it understood the Brazilian Ministério Público Federal ("MPF") was bringing an action against SEMAS, the DNPM and Chapleau Brazil. The action seeks to nullify the operating license previously granted to Chapleau Brazil by SEMAS and states that SEMAS should not have granted the license without requiring Chapleau Brazil to prepare a full socio-economic analysis and Environmental Impact Study ("EIS") for Coringa. Anfield and its legal counsel believe that Chapleau Brazil has complied with all applicable regulations. At an initial hearing the court denied a request from the MPF to cancel the operating licence and requested submissions from SEMAS, DNPM and Chapleau Brazil. A further hearing has not yet been scheduled. Anfield and Chapleau Brazil have in the meantime continued to progress the completion of a full EIS and this was submitted to SEMAS for approval on 24 November 2017.

## PRESS RELEASE 22 DECEMBER 2017

SERABI GOLD plc ("Serabi" or "the Company")

Serabi and its legal advisers have considered the position adopted by the MPF, and believe that the completion of the EIS should significantly address the main concerns of the MPF and have concluded, based on the current available information, that there is a low risk of significant delay to the licencing and permitting process.

Progress has also been made in several other areas relating to the development of Coringa. Applications for required camp and start-up water were submitted prior to the date of the Agreement and the tailings storage permit request was submitted on 11 December 2017. Discussions for long-term land access agreements are underway with the Instituto Nacional de Colonização e Reforma Agrária ("INCRA"), a government agency which claims ownership of the surface rights where the project is situated.

### Serabi's plans for Coringa following Closing of the Acquisition

Serabi intends to continue the work started by Anfield on the permitting and licencing process and will pursue the formal approval of the EIS and undertake any supplementary work or reports that may be requested. Serabi will review the cost estimates contained in the Coringa Feasibility Study and optimise these, prepare its own development plan and evaluate alternative construction development and processing options that Serabi's management could enhance the economics of the project.

Following Closing, development and construction at Coringa will be placed on care and maintenance whilst the permitting process is completed.

### Additional disclosures pursuant to the AIM Rules

Chapleau is not required to prepare audited financial statements. Based on information provided by Anfield and extracted from the unaudited consolidated financial statements of Anfield to 31 December 2016, Chapleau on a consolidated basis, reported a loss before taxation of C\$22.3 million for the 12 month period ended 31 December 2016 after (i) expensing exploration and evaluation expenditure of C\$7.9 million, (ii) recognising a foreign exchange loss of the capitalisation of intergroup loans into shares of Chapleau Brazil of C\$13.7 million, and (iii) other one-off costs estimated at C\$1.3 million. Chapleau had no revenues. As at 30 June 2017 total assets and shareholders' equity amounted to C\$19.6 million and C\$(20.3 million) respectively with shareholder loans totalling C\$38.6 million. The balance sheet carrying value of property, plant and equipment associated with the Coringa project as at 30 June 2017 amounted to C\$16.6 million which excludes past exploration costs as these have been expensed. As at 30 June 2017 Chapleau had net cash and cash equivalents of C\$2.5 million and except for intercompany loans (amounting to C\$38.6 million), which will be assigned to Serabi on Closing, had no borrowings.

## GLOSSARY OF TERMS

The following is a glossary of technical terms:

"Au" means gold.

"Assay" in economic geology, means to analyse the proportions of metal in a rock or overburden sample; to test an ore or mineral for composition, purity, weight or other properties of commercial interest.

"CIM" is the Canadian Institute of Mining, Metallurgy and Petroleum.

"Development" - excavations used to establish access to the mineralised rock and other workings.

"Doré – a semi-pure alloy of gold silver and other metals produced by the smelting process at a mine that will be subject to further refining.

"DNPM" is the Departamento Nacional de Produção Mineral.

"Grade" is the concentration of mineral within the host rock typically quoted as grams per tonne (g/t), parts per million (ppm) or parts per billion (ppb).

"g/t" means grams per tonne.

"Granodiorite" is an igneous intrusive rock similar to granite.

"Igneous" is a rock that has solidified from molten material or magma.

"Indicated Mineral Resource" is that part of a Mineral Resource for which quantity, grade or quality, densities, shape and physical characteristics, can be estimated with a level of confidence sufficient to allow the appropriate application of technical and economic parameters, to support mine planning and evaluation of the economic viability of the deposit. The estimate is based on detailed and reliable exploration and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes that are spaced closely enough for geological and grade continuity to be reasonably assumed.

"Inferred Mineral Resource" is that part of a Mineral Resource for which quantity and grade or quality can be estimated on the basis of geological evidence and limited sampling and reasonably assumed, but not verified, geological and grade continuity. The estimate is based on limited information and sampling gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes.

"Intrusive" is a body of igneous rock that invades older rocks.

"Induced polarization" or "IP" is a geophysical imaging technique used to identify the electrical chargeability of subsurface materials, such as ore.

"Measured Mineral Resource" is that part of a Mineral Resource for which quantity, grade or quality, densities, shape, and physical characteristics are so well established that they can be estimated with confidence sufficient to allow the appropriate application of technical and economic parameters, to support production planning and evaluation of the economic viability of the deposit. The estimate is based on detailed and reliable exploration, sampling and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes that are spaced closely enough to confirm both geological and grade continuity.

"Mineral Resource" is a concentration or occurrence of diamonds, natural solid inorganic material, or natural solid fossilized organic material including base and precious metals, coal, and industrial minerals in or on the Earth's crust in such form and quantity and of such a grade or quality that it has reasonable prospects for economic extraction. The location, quantity, grade, geological characteristics and continuity of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge.

"Mineral Reserve" is the economically mineable part of a Measured or Indicated Mineral Resource demonstrated by at least a Preliminary Feasibility Study. This Study must include adequate information on mining, processing, metallurgical, economic

**PRESS RELEASE 22 DECEMBER 2017**  
SERABI GOLD plc ("Serabi" or "the Company")

and other relevant factors that demonstrate, at the time of reporting, that economic extraction can be justified. A Mineral Reserve includes diluting materials and allowances for losses that may occur when the material is mined.

"Probable Mineral Reserve" is the economically mineable part of an Indicated and, in some circumstances, a Measured Mineral Resource demonstrated by at least a Preliminary Feasibility Study. This Study must include adequate information on mining, processing, metallurgical, economic, and other relevant factors that demonstrate, at the time of reporting, that economic extraction can be justified.

"Saprolite" is a weathered or decomposed clay-rich rock.

"Vein" is a generic term to describe an occurrence of mineralised rock within an area of non-mineralised rock.

---

#### **Forward-looking statements**

Certain statements in this announcement are, or may be deemed to be, forward looking statements. Forward looking statements are identified by their use of terms and phrases such as "believe", "could", "should", "envisage", "estimate", "intend", "may", "plan", "will" or the negative of those, variations or comparable expressions, including references to assumptions. These forward looking statements are not based on historical facts but rather on the Directors' current expectations and assumptions regarding the Company's future growth, results of operations, performance, future capital and other expenditures (including the amount, nature and sources of funding thereof), competitive advantages, business prospects and opportunities. Such forward looking statements reflect the Directors' current beliefs and assumptions and are based on information currently available to the Directors. A number of factors could cause actual results to differ materially from the results discussed in the forward looking statements including risks associated with vulnerability to general economic and business conditions, competition, environmental and other regulatory changes, actions by governmental authorities, the availability of capital markets, reliance on key personnel, uninsured and underinsured losses and other factors, many of which are beyond the control of the Company. Although any forward looking statements

contained in this announcement are based upon what the Directors believe to be reasonable assumptions, the Company cannot assure investors that actual results will be consistent with such forward looking statements.

#### **Qualified Persons Statement**

The scientific and technical information contained within this announcement has been reviewed and approved by Michael Hodgson, a Director of the Company. Mr Hodgson is an Economic Geologist by training with over 30 years' experience in the mining industry. He holds a BSc (Hons) Geology, University of London, a MSc Mining Geology, University of Leicester and is a Fellow of the Institute of Materials, Minerals and Mining and a Chartered Engineer of the Engineering Council of UK, recognizing him as both a Qualified Person for the purposes of Canadian National Instrument 43-101 and by the AIM Guidance Note on Mining and Oil & Gas Companies dated June 2009.

*Neither the Toronto Stock Exchange, nor any other securities regulatory authority, has approved or disapproved of the contents of this news release.*
